INFORMATION DISCLOSURE STATEMENT

Sir:

We enclose form PTO/SB/08A and copies of the documents identified therein. A copy of the European search report in which the documents were cited is also enclosed.

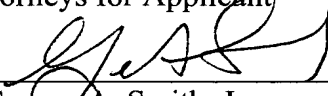

The French application, published under publication number 2,381,666, depicts a scheme for stacking of articles.

German laid-open application DE196 22 122 describes a transporting and assembly device for traction components in an internal combustion engine having a holding element (1) with at least two elements (2,4) secured in a seating (10,15). The seating of the elements is with at least a sprung elastic boss (11,17) on each grip (13) of the holding element. The grip for stripping the holding piece from the element can be seen. The holding element may be seen with an end face with openings (14,20) for the seats. An opposite facing end grip may have a handle on it.

German laid-open application DE 40 25 126 describes the assembling of a camshaft drive to an engine block by clipping pre-positioned parts in a cage. The components (2a to 2e) to be assembled, e.g. the pulleys, timing belt etc. of a camshaft drive, are located in correct relationship by fingers (4) which are formed as open sided clips engaging a diameter of the components. The cage is offered up to the face of the engine, and the individual components secured in place. The cage can then be slid out in a given direction (5).

In robotic assembly, the components may be stored in correct relationship in a special rack and transferred to the cage for assembly by insertion of the cage in the opposite direction. The invention is said to provide an engine manufacturer. with higher productivity and reduced cost of assembly.

Respectfully submitted,
